

# Package ‘CEMiTool’

April 9, 2025

**Title** Co-expression Modules identification Tool

**Version** 1.31.0

**Description** The CEMiTool package unifies the discovery and the analysis of coexpression gene modules in a fully automatic manner, while providing a user-friendly html report with high quality graphs. Our tool evaluates if modules contain genes that are over-represented by specific pathways or that are altered in a specific sample group. Additionally, CEMiTool is able to integrate transcriptomic data with interactome information, identifying the potential hubs on each network.

**Depends** R (>= 4.0)

**Imports** methods, scales, dplyr, data.table (>= 1.9.4), WGCNA, grid, ggplot2, ggpmisc, ggthemes, ggrepel, sna, clusterProfiler, fgsea, stringr, knitr, rmarkdown, igraph, DT, htmltools, pracma, intergraph, grDevices, utils, network, matrixStats, ggdendro, gridExtra, gtable, fastcluster

**Suggests** testthat, BiocManager

**License** GPL-3

**Encoding** UTF-8

**biocViews** GeneExpression, Transcriptomics, GraphAndNetwork, mRNAArray, RNASeq, Network, NetworkEnrichment, Pathways, ImmunoOncology

**LazyData** true

**RoxygenNote** 7.1.2

**VignetteBuilder** knitr

**git\_url** <https://git.bioconductor.org/packages/CEMiTool>

**git\_branch** devel

**git\_last\_commit** 3dd9735

**git\_last\_commit\_date** 2024-10-29

**Repository** Bioconductor 3.21

**Date/Publication** 2025-04-09

**Author** Pedro Russo [aut],  
 Gustavo Ferreira [aut],  
 Matheus Bürger [aut],  
 Lucas Cardozo [aut],  
 Diogenes Lima [aut],  
 Thiago Hirata [aut],  
 Melissa Lever [aut],  
 Helder Nakaya [aut, cre]

**Maintainer** Helder Nakaya <hnakaya@usp.br>

---

|          |  |
|----------|--|
| adj_data | <i>Get or set adjacency matrix value</i> |
|----------|--|

---

## Description

This function takes a CEMiTool object containing expression values and returns a CEMiTool object with an adjacency matrix in the adjacency slot.

## Usage

```
adj_data(cem, ...)
```

```
## S4 method for signature 'CEMiTool'
```

```
adj_data(cem)
```

```
adj_data(cem) <- value
```

```
## S4 replacement method for signature 'CEMiTool'
```

```
adj_data(cem) <- value
```

## Arguments

|       |  |
|-------|--|
| cem   | Object of class CEMiTool   |
| ...   | Optional parameters.   |
| value | Object of class matrix containing adjacency data. Only used for setting adjacency values to CEMiTool object. |

**Value**

Object of class matrix with adjacency values or object of class CEMiTool.

**Examples**

```
# Get example expression data
data(expr0)
# Initialize new CEMiTool object with expression
cem <- new_cem(expr0, filter=TRUE, apply_vst=FALSE)
# Calculate adjacency matrix with example beta value 8
cem <- get_adj(cem, beta=8)
# Return adjacency matrix
adj <- adj_data(cem)
# Check result
adj[1:5, 1:5]
# Set adjacency matrix to CEMiTool object
adj_data(cem) <- adj
```

---

cem

*CEMiTool Object*

---

**Description**

This object can be used as input for CEMiTool functions. Data used are from expr and sample\_annot.

**Usage**

```
data(cem)
```

**Format**

An object of class CEMiTool

**Examples**

```
# Get example CEMiTool object
data(cem)
cem
```

---

|          |   |
|----------|---|
| cemitool | <i>Full gene co-expression analysis</i> |
|----------|---|

---

**Description**

Defines co-expression modules and runs several different analyses.

**Usage**

```
cemitool(  
  expr,  
  annot,  
  gmt,  
  interactions,  
  filter = TRUE,  
  filter_pval = 0.1,  
  apply_vst = FALSE,  
  n_genes,  
  eps = 0.1,  
  cor_method = c("pearson", "spearman"),  
  cor_function = "cor",  
  network_type = "unsigned",  
  tom_type = "signed",  
  set_beta = NULL,  
  force_beta = FALSE,  
  sample_name_column = "SampleName",  
  class_column = "Class",  
  merge_similar = TRUE,  
  rank_method = "mean",  
  ora_pval = 0.05,  
  gsea_scale = TRUE,  
  gsea_min_size = 15,  
  gsea_max_size = 1000,  
  min_nngen = 30,  
  diss_thresh = 0.8,  
  plot = TRUE,  
  plot_diagnostics = TRUE,  
  order_by_class = TRUE,  
  center_func = "mean",  
  directed = FALSE,  
  verbose = FALSE  
)
```

**Arguments**

|       |                               |
|-------|-------------------------------|
| expr  | Gene expression data.frame.   |
| annot | Sample annotation data.frame. |

|                    |  |
|--------------------|--|
| gmt                | A data.frame containing two columns, one with pathways and one with genes  |
| interactions       | A data.frame containing two columns with gene names.   |
| filter             | Logical. If TRUE, will filter expression data.   |
| filter_pval        | P-value threshold for filtering. Default 0.1.  |
| apply_vst          | Logical. If TRUE, will apply Variance Stabilizing Transform before filtering genes. Currently ignored if parameter filter is FALSE.  |
| n_genes            | Number of genes left after filtering.  |
| eps                | A value for accepted R-squared interval between subsequent beta values. Default is 0.1.  |
| cor_method         | A character string indicating which correlation coefficient is to be computed. One of "pearson" or "spearman". Default is "pearson".   |
| cor_function       | A character string indicating the correlation function to be used. Supported functions are currently 'cor' and 'bicor'. Default is "cor"   |
| network_type       | A character string indicating if network type should be computed as "signed" or "unsigned". Default is "unsigned"  |
| tom_type           | A character string indicating if the TOM type should be computed as "signed" or "unsigned". Default is "signed"  |
| set_beta           | A value to override the automatically selected beta value. Default is NULL.  |
| force_beta         | Whether or not to automatically force a beta value based on number of samples. Default is FALSE.   |
| sample_name_column | A character string indicating the sample column name of the annotation table.  |
| class_column       | A character string indicating the class column name of the annotation table.   |
| merge_similar      | Logical. If TRUE, merge similar modules.   |
| rank_method        | Character string indicating how to rank genes. Either "mean" (the default) or "median".  |
| ora_pval           | P-value for overrepresentation analysis. Default 0.05.   |
| gsea_scale         | If TRUE, apply z-score transformation for GSEA analysis. Default is TRUE   |
| gsea_min_size      | Minimum size of gene sets for GSEA analysis. Default is 15   |
| gsea_max_size      | Maximum size of gene sets for GSEA analysis. Default is 1000   |
| min_nngen          | Minimal number of genes per submodule. Default 30.   |
| diss_thresh        | Module merging correlation threshold for eigengene similarity. Default 0.8.  |
| plot               | Logical. If TRUE, plots all figures.   |
| plot_diagnostics   | Logical. If TRUE, creates diagnostic plots. Overwritten if plot=FALSE.   |
| order_by_class     | Logical. If TRUE, samples in profile plot are ordered by the groups defined by the class_column slot in the sample annotation file. Ignored if there is no sample_annotation file. Default TRUE. |
| center_func        | Character string indicating the centrality measure to show in the plot. Either 'mean' (the default) or 'median'.   |
| directed           | Logical. If TRUE, the igraph objects in interactions slot will be directed.  |
| verbose            | Logical. If TRUE, reports analysis steps.  |

**Value**

Object of class CEMiTool

**Examples**

```
# Get example expression data
data(expr0)
# Run CEMiTool analyses
cem <- cemitool(expr=expr0)
# Run CEMiTool applying Variance Stabilizing Transformation to data
cem <- cemitool(expr=expr0, apply_vst=TRUE)
# Run CEMiTool with additional processing messages
cem <- cemitool(expr=expr0, verbose=TRUE)

## Not run:
# Run full CEMiTool analysis
## Get example sample annotation data
data(sample_annot)
## Read example pathways file
gmt_fname <- system.file("extdata", "pathways.gmt", package = "CEMiTool")
gmt_in <- read_gmt(gmt_fname)
## Get example interactions file
int_df <- read.delim(system.file("extdata", "interactions.tsv", package = "CEMiTool"))
## Run CEMiTool
cem <- cemitool(expr=expr0, annot=sample_annot, gmt=gmt_in,
  interactions=int_df, verbose=TRUE, plot=TRUE)

# Create report as html file
generate_report(cem, directory = "./Report", output_format="html_document")

# Write analysis results into files
write_files(cem, directory="./Tables", force=TRUE)

# Save all plots
save_plots(cem, "all", directory="./Plots")

## End(Not run)
```

---

CEMiTool-class

*An S4 class to represent the CEMiTool analysis.*

---

**Description**

An S4 class to represent the CEMiTool analysis.

**Slots**

expression Gene expression data.frame.  
 sample\_annotation Sample annotation data.frame.

`fit_indices` `data.frame` containing scale-free model fit, soft-threshold and network parameters.  
`selected_genes` Character vector containing the names of genes selected for analysis  
`module` Genes in modules information `data.frame`.  
`enrichment` `list` with modules enrichment results for sample classes.  
`ora` Over-representation analysis results `data.frame`.  
`interactions` `list` containing gene interactions present in modules.  
`interaction_plot` `list` of `ggplot` graphs with module gene interactions.  
`profile_plot` `list` of `ggplot` graphs with gene expression profile per module.  
`enrichment_plot` `ggplot` graph for enrichment analysis results.  
`beta_r2_plot` `ggplot` graph with scale-free topology fit results for each soft-threshold.  
`mean_k_plot` `ggplot` graph with mean network connectivity.  
`barplot_ora` `list` of `ggplot` graphs with over-representation analysis results per module.  
`sample_tree_plot` `gtable` containing sample dendrogram with class labels and clinical data (if available in `sample_annotation(cem)`).  
`mean_var_plot` Mean x variance scatterplot.  
`hist_plot` Expression histogram.  
`qq_plot` Quantile-quantile plot.  
`sample_name_column` character string containing the name of the column with sample names in the annotation file.  
`class_column` character string containing the name of the column with class names in the annotation file.  
`mod_colors` character vector containing colors associated with each network module.  
`parameters` `list` containing analysis parameters.  
`adjacency` `matrix` containing gene adjacency values based on correlation

### Examples

```

# Get example expression data
data(expr0)
# Initialize CEMiTool object with expression
cem <- new("CEMiTool", expression=expr0)

```

---

`diagnostic_report`      *Diagnostic report*

---

### Description

Creates report for identifying potential problems with data.

**Usage**

```

diagnostic_report(cem, ...)

## S4 method for signature 'CEMiTool'
diagnostic_report(
  cem,
  title = "Diagnostics",
  directory = "./Reports/Diagnostics",
  force = FALSE,
  ...
)

```

**Arguments**

|           |   |
|-----------|---|
| cem       | Object of class CEMiTool.                         |
| ...       | parameters to rmarkdown::render                   |
| title     | Character string with the title of the report.    |
| directory | Directory name for results.                       |
| force     | If the directory exists, execution will not stop. |

**Value**

An HTML file with an interactive diagnostic report.

---

 expr0

*Yellow Fever gene expression data from GEO study GSE13485*

---

**Description**

Modified data from a yellow fever vaccination study by Querec et al, 2009. In order to reduce package size, only the 4000 genes with the highest variance were selected for this dataset.

**Usage**

```
data(expr0)
```

**Format**

An object of class data.frame

**Source**

**GEO**

## References

## Examples

```
data(expr0)
# Run CEMiTool analysis
## Not run: cemitoool(expr0)
```

---

|           |  |
|-----------|--|
| expr_data | <i>Retrieve and set expression attribute</i> |
|-----------|--|

---

## Description

Retrieve and set expression attribute

## Usage

```
expr_data(cem, ...)
```

## S4 method for signature 'CEMiTool'

```
expr_data(cem, filter = TRUE, apply_vst = FALSE, filter_pval = 0.1, ...)
```

```
expr_data(cem) <- value
```

## S4 replacement method for signature 'CEMiTool'

```
expr_data(cem) <- value
```

## Arguments

|             |   |
|-------------|---|
| cem         | Object of class CEMiTool  |
| ...         | Additional parameters to filter_genes or select_genes functions.                                  |
| filter      | logical. If TRUE, retrieves filtered expression data (Default: TRUE)                              |
| apply_vst   | logical. If TRUE, applies variance stabilizing transformation to expression data (Default: FALSE) |
| filter_pval | logical. Threshold for filter p-value. Ignored if filter = FALSE (Default: 0.1)                   |
| value       | Object of class data.frame with gene expression data  |

## Value

Object of class data.frame with gene expression data

**Examples**

```
# Initialize an empty CEMiTool object
cem <- new_cem()
# Get example expression data
data(expr0)
# Add expression file to CEMiTool object
expr_data(cem) <- expr0
# Check expression file
head(expr_data(cem))
```

---

|                 |  |
|-----------------|--|
| expr_pct_filter | <i>Filter genes based on expression.</i> |
|-----------------|--|

---

**Description**

Filter genes based on expression.

**Usage**

```
expr_pct_filter(expr, pct = 0.75)
```

**Arguments**

|      |   |
|------|---|
| expr | expression file containing genes in the rows and samples in the columns |
| pct  | percentage of most expressed genes to maintain                          |

**Value**

A data.frame containing the results

---

|              |  |
|--------------|--|
| filter_genes | <i>Filter a gene expression data.frame</i> |
|--------------|--|

---

**Description**

Filter a gene expression data.frame

**Usage**

```
filter_genes(expr, pct = 0.75, apply_vst = FALSE)
```

**Arguments**

|           |  |
|-----------|--|
| expr      | A data.frame containing expression data  |
| pct       | Percentage of most expressed genes to keep.  |
| apply_vst | Logical. If TRUE, will apply variance stabilizing transform before filtering data. |

**Details**

This function takes a gene expression data.frame and applies a percentage filter (keeps the pct) most expressed genes). If apply\_vst is TRUE, a variance stabilizing transformation is applied on gene expression values as long as mean and variance values have a Spearman's rho of over 0.5. This transformation is intended to remove this dependence between the parameters. One should then apply the select\_genes function to get significant genes.

**Value**

A data.frame containing filtered expression data

**Examples**

```
# Get example expression data
data(expr0)
# Filter genes
expr_f <- filter_genes(expr0)
# Check selected genes
expr_f[1:5, 1:5]
# Filter genes and apply variance stabilizing transformation
expr_f2 <- filter_genes(expr0, apply_vst=TRUE)
# Check results
expr_f2[1:5, 1:5]
# Selected genes
selected <- select_genes(expr_f2)
# Get data.frame with only selected genes
expr_s <- expr_f2[selected, ]
# Check results
expr_s[1:5, 1:5]
```

---

find\_modules

*Co-expression modules definition*

---

**Description**

Defines co-expression modules

**Usage**

```
find_modules(cem, ...)
```

```
## S4 method for signature 'CEMiTool'
find_modules(
  cem,
  cor_method = c("pearson", "spearman"),
  cor_function = "cor",
  eps = 0.1,
  set_beta = NULL,
```

```

    force_beta = FALSE,
    min_ngen = 20,
    merge_similar = TRUE,
    network_type = "unsigned",
    tom_type = "signed",
    diss_thresh = 0.8,
    verbose = FALSE
  )

```

### Arguments

|                            |   |
|----------------------------|---|
| <code>cem</code>           | Object of class CEMiTool.   |
| <code>...</code>           | Optional parameters.  |
| <code>cor_method</code>    | A character string indicating which correlation coefficient is to be computed. Default "pearson"          |
| <code>cor_function</code>  | A character string indicating the correlation function to be used. Default 'cor'.                         |
| <code>eps</code>           | A value for accepted R-squared interval between subsequent beta values. Default is 0.1.                   |
| <code>set_beta</code>      | A value to override the automatically selected beta value. Default is NULL.                               |
| <code>force_beta</code>    | Whether or not to automatically force a beta value based on number of samples. Default is FALSE.          |
| <code>min_ngen</code>      | Minimal number of genes per submodule. Default 20.  |
| <code>merge_similar</code> | Logical. If TRUE, (the default) merge similar modules.  |
| <code>network_type</code>  | A character string indicating to use either "unsigned" (default) or "signed" networks. Default "unsigned" |
| <code>tom_type</code>      | A character string indicating to use either "unsigned" or "signed" (default) TOM similarity measure.      |
| <code>diss_thresh</code>   | Module merging correlation threshold for eigengene similarity. Default 0.8.                               |
| <code>verbose</code>       | Logical. If TRUE, reports analysis steps. Default FALSE   |

### Value

Object of class CEMiTool

### Examples

```

# Get example expression data
data(expr0)
# Initialize CEMiTool object with expression
cem <- new_cem(expr0, filter=TRUE, apply_vst=FALSE)
# Define network modules
cem <- find_modules(cem)
# Check results
head(module_genes(cem))

```

---

|          |   |
|----------|---|
| fit_data | <i>Retrieve scale-free model fit data</i> |
|----------|---|

---

**Description**

Retrieve scale-free model fit data

**Usage**

```
fit_data(cem)

## S4 method for signature 'CEMiTool'
fit_data(cem)
```

**Arguments**

cem                    Object of class CEMiTool

**Value**

Object of class data.frame

**Examples**

```
# Get example CEMiTool object
data(cem)
# Get modules and beta data
cem <- find_modules(cem)
# Get fit data
fit_data(cem)
```

---

|                 |                        |
|-----------------|------------------------|
| generate_report | <i>CEMiTool report</i> |
|-----------------|------------------------|

---

**Description**

Creates report for CEMiTool results

**Usage**

```
generate_report(cem, ...)  
  
## S4 method for signature 'CEMiTool'  
generate_report(  
  cem,  
  max_rows_ora = 50,  
  title = "Report",  
  directory = "./Reports/Report",  
  force = FALSE,  
  ...  
)
```

**Arguments**

|              |  |
|--------------|--|
| cem          | Object of class CEMiTool.  |
| ...          | parameters to rmarkdown::render                                      |
| max_rows_ora | maximum number of rows in Over Representation Analysis table results |
| title        | Character string with the title of the report.                       |
| directory    | Directory name for results.  |
| force        | If the directory exists, execution will not stop.                    |

**Value**

An HTML file with an interactive report of CEMiTool analyses.

**Examples**

```
## Not run:  
# Get example CEMiTool object  
data(cem)  
generate_report(cem, output_format=c("pdf_document", "html_document"))  
  
## End(Not run)
```

---

get\_adj

*Calculate adjacency matrix*

---

**Description**

This function takes a CEMiTool object and returns an adjacency matrix.

**Usage**

```
get_adj(cem, ...)

## S4 method for signature 'CEMiTool'
get_adj(
  cem,
  beta,
  network_type = "unsigned",
  cor_function = "cor",
  cor_method = "pearson"
)
```

**Arguments**

|              |  |
|--------------|--|
| cem          | Object of class CEMiTool   |
| ...          | Optional parameters.   |
| beta         | Selected soft-threshold value  |
| network_type | A character string indicating to use either "unsigned" (default) or "signed" networks. Default "unsigned". |
| cor_function | A character string indicating the correlation function to be used. Default 'cor'.                          |
| cor_method   | A character string indicating which correlation coefficient is to be computed. Default "pearson".          |

**Value**

Object of class CEMiTool with adjacency data

**Examples**

```
# Get example expression data
data(expr0)
# Initialize new CEMiTool object with expression data
cem <- new_cem(expr0, filter=TRUE, apply_vst=FALSE)
# Calculate adjacency matrix with example beta value 8
cem <- get_adj(cem, beta=8)
# Check results
adj <- adj_data(cem)
adj[1:5, 1:5]
```

---

get\_beta\_data

*Soft-threshold beta data*

---

**Description**

This function takes the input parameters from find\_modules and calculates the WGCNA soft-threshold parameters and returns them.

**Usage**

```
get_beta_data(cem, ...)

## S4 method for signature 'CEMiTool'
get_beta_data(
  cem,
  network_type = "unsigned",
  cor_function = "cor",
  cor_method = "pearson",
  verbose = FALSE
)
```

**Arguments**

|              |  |
|--------------|--|
| cem          | A CEMiTool object containing expression data   |
| ...          | Optional parameters.   |
| network_type | A character string indicating to use either "unsigned" (default) or "signed" networks. Default "unsigned". |
| cor_function | A character string indicating the correlation function to be used. Default 'cor'.                          |
| cor_method   | A character string indicating which correlation coefficient is to be computed. Default "pearson"           |
| verbose      | Logical. If TRUE, reports analysis steps. Default FALSE  |

**Value**

A list containing the soft-threshold selected by WGCNA and scale-free model parameters

**Examples**

```
# Get example expression data
data(expr0)
# Initialize new CEMiTool object with expression data
cem <- new_cem(expr0, filter=TRUE, apply_vst=FALSE)
# Get beta data
beta_data <- get_beta_data(cem)
```

---

get\_cemitoool\_r2\_beta    *Calculate CEMiTool beta and R2 values*

---

**Description**

This function takes a CEMiTool object with beta data and returns a vector containing the chosen beta and corresponding R squared value.

**Usage**

```
get_cemitoool_r2_beta(cem, ...)

## S4 method for signature 'CEMiTool'
get_cemitoool_r2_beta(cem, eps = 0.1)
```

**Arguments**

|     |  |
|-----|--|
| cem | A CEMiTool object containing the fit_indices slot  |
| ... | Optional parameters.   |
| eps | A value indicating the accepted interval between successive values of R squared to use to calculate the selected beta. Default: 0.1. |

**Value**

A vector containing R squared value and the chosen beta parameter.

**Examples**

```
# Get example expression data
data(expr0)
# Initialize new CEMiTool object with expression data
cem <- new_cem(expr0, filter=TRUE, apply_vst=FALSE)
# Get modules and beta data
cem <- find_modules(cem)
# Get CEMiTool R2 and beta values
get_cemitoool_r2_beta(cem)
```

---

|                  |                                       |
|------------------|---------------------------------------|
| get_connectivity | <i>Calculate network connectivity</i> |
|------------------|---------------------------------------|

---

**Description**

This function takes a CEMiTool object and returns the network connectivity.

**Usage**

```
get_connectivity(cem, ...)

## S4 method for signature 'CEMiTool'
get_connectivity(cem, beta)
```

**Arguments**

|      |  |
|------|--|
| cem  | Object of class CEMiTool containing the fit_indices slot |
| ...  | Optional parameters.                                     |
| beta | A soft-thresholding value to be used for the network.    |

**Value**

The value of the network's connectivity.

**Examples**

```
# Get example expression data
data(expr0)
# Initialize new CEMiTool object with expression data
cem <- new_cem(expr0, filter=TRUE, apply_vst=FALSE)
# Get modules and beta data
cem <- find_modules(cem)
# Get network connectivity with example beta value 8
get_connectivity(cem, beta=8)
```

---

get\_hubs

*Get hubs*

---

**Description**

Returns n genes in each module with high connectivity.

**Usage**

```
get_hubs(cem, ...)

## S4 method for signature 'CEMiTool'
get_hubs(cem, n = 5, method = "adjacency")
```

**Arguments**

|        |   |
|--------|---|
| cem    | Object of class CEMiTool.   |
| ...    | Optional parameters.  |
| n      | Number of hubs to return from each module. If "all", returns all genes in decreasing order of connectivity. Default: 5. |
| method | Method for hub calculation. Either "adjacency" or "kME". Default: "adjacency"   |

**Value**

A list containing hub genes for each module and the value of the calculated method.

**Examples**

```
# Get example CEMiTool object
data(cem)
# Get module hubs
hubs <- get_hubs(cem, n=10, "adjacency")
```

---

get\_merged\_mods      *Merge similar modules*

---

### Description

This function takes a CEMiTool object with expression and a vector of numeric labels to merge similar modules.

### Usage

```
get_merged_mods(cem, ...)  
  
## S4 method for signature 'CEMiTool'  
get_merged_mods(cem, mods, diss_thresh = 0.8, verbose = FALSE)
```

### Arguments

|             |   |
|-------------|---|
| cem         | Object of class CEMiTool.                                 |
| ...         | Optional parameters.                                      |
| mods        | A vector containing numeric labels for each module gene   |
| diss_thresh | A threshold of dissimilarity for modules. Default is 0.8. |
| verbose     | Logical. If TRUE, reports analysis steps. Default FALSE   |

### Value

Numeric labels assigning genes to modules.

### Examples

```
# Get example expression data  
data(expr0)  
# Initialize new CEMiTool object with expression data  
cem <- new_cem(expr0, filter=TRUE, apply_vst=FALSE)  
# Calculate adjacency matrix with example beta value 8  
cem <- get_adj(cem, beta=8)  
# Get modules  
mods <- get_mods(cem)  
# Merge similar modules  
merged_mods <- get_merged_mods(cem, mods)
```

---

|          |  |
|----------|--|
| get_mods | <i>Calculate co-expression modules</i> |
|----------|--|

---

### Description

This function takes a CEMiTool object containing an adjacency matrix together with the given network parameters, and returns the given co-expression modules.

### Usage

```
get_mods(cem, ...)  
  
## S4 method for signature 'CEMiTool'  
get_mods(  
  cem,  
  cor_function = "cor",  
  cor_method = "pearson",  
  tom_type = "signed",  
  min_nngen = 20  
)
```

### Arguments

|              |  |
|--------------|--|
| cem          | Object of class CEMiTool.  |
| ...          | Optional parameters.   |
| cor_function | A character string indicating the correlation function to be used. Default 'cor'.                    |
| cor_method   | A character string indicating which correlation coefficient is to be computed. Default "pearson".    |
| tom_type     | A character string indicating to use either "unsigned" or "signed" (default) TOM similarity measure. |
| min_nngen    | Minimal number of genes per module (Default: 20).  |

### Value

Numeric labels assigning genes to modules.

### Examples

```
# Get example expression data  
data(expr0)  
# Initialize new CEMiTool object with expression data  
cem <- new_cem(expr0, filter=TRUE, apply_vst=FALSE)  
# Calculate adjacency matrix with example beta value 8  
cem <- get_adj(cem, beta=8)  
# Get module labels  
mods <- get_mods(cem)
```

---

|         |                      |
|---------|----------------------|
| get_phi | <i>Calculate phi</i> |
|---------|----------------------|

---

**Description**

This function takes a CEMiTool object and returns the phi parameter.

**Usage**

```
get_phi(cem, ...)  
  
## S4 method for signature 'CEMiTool'  
get_phi(cem)
```

**Arguments**

|     |   |
|-----|---|
| cem | A CEMiTool object containing the fit_indices slot |
| ... | Optional parameters.                              |

**Value**

The phi parameter

**Examples**

```
# Get example expression data  
data(expr0)  
# Initialize new CEMiTool object with expression data  
cem <- new_cem(expr0, filter=TRUE, apply_vst=FALSE)  
# Get modules and beta data  
cem <- find_modules(cem)  
# Get phi  
get_phi(cem)
```

---

|           |   |
|-----------|---|
| gsea_data | <i>Retrieve Gene Set Enrichment Analysis (GSEA) results</i> |
|-----------|---|

---

**Description**

Retrieve Gene Set Enrichment Analysis (GSEA) results

**Usage**

```
gsea_data(cem)  
  
## S4 method for signature 'CEMiTool'  
gsea_data(cem)
```

**Arguments**

cem                    Object of class CEMiTool

**Value**

Object of class list with GSEA data

**Examples**

```
# Get example CEMiTool object
data(cem)
# Look at example annotation file
sample_annotation(cem)
# Run GSEA on network modules
cem <- mod_gsea(cem)
# Check results
gsea_data(cem)
```

---

interactions\_data        *Retrieve and set interaction data to CEMiTool object*

---

**Description**

Retrieve and set interaction data to CEMiTool object

**Usage**

```
interactions_data(cem, ...)
```

```
## S4 method for signature 'CEMiTool'
interactions_data(cem)
```

```
interactions_data(cem) <- value
```

```
## S4 replacement method for signature 'CEMiTool'
interactions_data(cem) <- value
```

**Arguments**

cem                    Object of class CEMiTool.  
...                    parameters for `igraph::graph_from_data_frame`  
value                  a data.frame or matrix containing two columns

**Value**

Object of class CEMiTool

## Examples

```
# Get example CEMiTool object
data(cem)
# Read example interactions data
int_df <- read.delim(system.file("extdata", "interactions.tsv",
  package = "CEMiTool"))
# Insert interactions data
interactions_data(cem) <- int_df
# Check interactions data
interactions_data(cem)
```

---

module\_genes

*Get the module genes in a CEMiTool object*

---

## Description

Get the module genes in a CEMiTool object

## Usage

```
module_genes(cem, module = NULL)

## S4 method for signature 'CEMiTool'
module_genes(cem, module = NULL)
```

## Arguments

|        |   |
|--------|---|
| cem    | Object of class CEMiTool  |
| module | A character string with the name of the module of which genes are to be returned. Defaults to NULL, which returns the full list of genes and modules. |

## Value

Object of class data.frame containing genes and their respective module

## Examples

```
# Get example CEMiTool object
data(cem)
# Get the module genes
module_genes(cem)
# Get genes for module M1
module_genes(cem, module="M1")
```

---

|               |  |
|---------------|--|
| module_to_gmt | <i>Transform module genes list to a gmt file</i> |
|---------------|--|

---

**Description**

Transform module genes list to a gmt file

**Usage**

```
module_to_gmt(cem, directory = "../Tables")
```

**Arguments**

cem

**Value**

A .gmt file containing module genes in each row

---

|            |  |
|------------|--|
| mod_colors | <i>Retrieve and set mod_colors attribute</i> |
|------------|--|

---

**Description**

Retrieve and set mod\_colors attribute

**Usage**

```
mod_colors(cem)

## S4 method for signature 'CEMiTool'
mod_colors(cem)

mod_colors(cem) <- value

## S4 replacement method for signature 'CEMiTool,character'
mod_colors(cem) <- value
```

**Arguments**

|       |  |
|-------|--|
| cem   | Object of class CEMiTool   |
| value | a character vector containing colors for each module. Names should match with module names |

**Value**

A vector with color names.

**Examples**

```
# Get example CEMiTool object
data(cem)
# See module colors
mod_colors(cem)
```

---

|              |  |
|--------------|--|
| mod_gene_num | <i>Get the number of genes in modules in a CEMiTool object</i> |
|--------------|--|

---

**Description**

Get the number of genes in modules in a CEMiTool object

**Usage**

```
mod_gene_num(cem, module = NULL)

## S4 method for signature 'CEMiTool'
mod_gene_num(cem, module = NULL)
```

**Arguments**

|        |   |
|--------|---|
| cem    | Object of class CEMiTool  |
| module | Default is NULL. If a character string designating a module is given, the number of genes in that module is returned instead. |

**Value**

The number of genes in module(s)

**Examples**

```
# Get example CEMiTool object
data(cem)
# Get the number of genes in modules
mod_gene_num(cem)
# Get the number of genes in module M1
mod_gene_num(cem, "M1")
```

---

`mod_gsea`*Module Gene Set Enrichment Analysis*

---

**Description**

Performs Gene Set Enrichment Analysis (GSEA) for each co-expression module found.

**Usage**

```
mod_gsea(cem, ...)  
  
## S4 method for signature 'CEMiTool'  
mod_gsea(  
  cem,  
  gsea_scale = TRUE,  
  rank_method = "mean",  
  gsea_min_size = 15,  
  gsea_max_size = 1000,  
  verbose = FALSE  
)
```

**Arguments**

|                            |   |
|----------------------------|---|
| <code>cem</code>           | Object of class CEMiTool.   |
| <code>...</code>           | Optional parameters.  |
| <code>gsea_scale</code>    | If TRUE, transform data using z-score transformation. Default: TRUE                     |
| <code>rank_method</code>   | Character string indicating how to rank genes. Either "mean" (the default) or "median". |
| <code>gsea_min_size</code> | Minimum gene set size (Default: 15).  |
| <code>gsea_max_size</code> | Maximum gene set size (Default: 1000).  |
| <code>verbose</code>       | logical. Report analysis steps.   |

**Value**

GSEA results.

**See Also**

[plot\\_gsea](#)

## Examples

```
# Get example CEMiTool object
data(cem)
# Look at example annotation file
sample_annotation(cem)
# Run GSEA on network modules
cem <- mod_gsea(cem)
# Check results
gsea_data(cem)
```

---

mod\_names

*Get module names in a CEMiTool object*

---

## Description

Get module names in a CEMiTool object

## Usage

```
mod_names(cem, include_NC = TRUE)

## S4 method for signature 'CEMiTool'
mod_names(cem, include_NC = TRUE)
```

## Arguments

cem                    Object of class CEMiTool

include\_NC           Logical. Whether or not to include "Not.Correlated" module. Defaults to TRUE.

## Value

Module names

## Examples

```
# Get example CEMiTool object
data(cem)
# Get module names
mod_names(cem)
```

---

mod\_ora

*Module Overrepresentation Analysis*

---

## Description

Performs overrepresentation analysis for each co-expression module found.

## Usage

```
mod_ora(cem, ...)
```

```
## S4 method for signature 'CEMiTool'  
mod_ora(cem, gmt, verbose = FALSE)
```

## Arguments

|         |   |
|---------|---|
| cem     | Object of class CEMiTool.   |
| ...     | Optional parameters.  |
| gmt     | Object of class data.frame with 2 columns, one with pathways and one with genes |
| verbose | logical. Report analysis steps.   |

## Value

Object of class CEMiTool

## See Also

[ora\\_data](#)

## Examples

```
# Get example CEMiTool object  
data(cem)  
# Read gmt file  
gmt <- read_gmt(system.file('extdata', 'pathways.gmt',  
                           package='CEMiTool'))  
# Run module overrepresentation analysis  
cem <- mod_ora(cem, gmt)  
# Check results  
head(ora_data(cem))
```

---

`mod_summary`*Co-expression module summarization*

---

**Description**

Summarizes modules using mean or eigengene expression.

**Usage**

```
mod_summary(cem, ...)
```

```
## S4 method for signature 'CEMiTool'  
mod_summary(cem, method = c("mean", "median", "eigengene"), verbose = FALSE)
```

**Arguments**

|                      |  |
|----------------------|--|
| <code>cem</code>     | Object of class CEMiTool.  |
| <code>...</code>     | Optional parameters.   |
| <code>method</code>  | A character string indicating which summarization method is to be used. Can be 'eigengene', 'mean' or 'median'. Default is 'mean'. |
| <code>verbose</code> | Logical. If TRUE, reports analysis steps.  |

**Value**

A data.frame with summarized values.

**Examples**

```
# Get example CEMiTool object  
data(cem)  
# Summarize results  
mod_summary <- mod_summary(cem)
```

---

`new_cem`*Create a CEMiTool object*

---

**Description**

Create a CEMiTool object

**Usage**

```
new_cem(
  expr = data.frame(),
  sample_annot = data.frame(),
  sample_name_column = "SampleName",
  class_column = "Class",
  filter = TRUE,
  apply_vst = FALSE,
  filter_pval = 0.1
)
```

**Arguments**

|                                 |   |
|---------------------------------|---|
| <code>expr</code>               | Object of class <code>data.frame</code> with gene expression data   |
| <code>sample_annot</code>       | Object of <code>data.frame</code> containing the sample annotation. It should have at least two columns containing group <code>Class</code> and the Sample Name that should match with samples in expression file |
| <code>sample_name_column</code> | A string specifying the column to be used as sample identification. Default: "SampleName".  |
| <code>class_column</code>       | A string specifying the column to be used as a grouping factor for samples. Default: "Class"  |
| <code>filter</code>             | Logical. Used to define if posterior functions should use filtered expression data or not (Default: TRUE)   |
| <code>apply_vst</code>          | Logical. Used to define if posterior functions should use a variance stabilizing transformation on expression data before analyses. Only valid if argument <code>filter</code> is TRUE. (Default: FALSE)          |
| <code>filter_pval</code>        | logical. Threshold for filter p-value. Ignored if <code>filter = FALSE</code> (Default: 0.1)  |

**Value**

Object of class `CEMiTool`

**Examples**

```
# Create new CEMiTool object
cem <- new_cem()
# Create new CEMiTool object with expression and sample_annotation data
data(expr0)
data(sample_annot)
cem <- new_cem(expr0, sample_annot, "SampleName", "Class")
# Equivalent to a call to new()
cem2 <- new("CEMiTool", expression=expr0, sample_annotation=sample_annot)
identical(cem, cem2)
```

---

|          |   |
|----------|---|
| nmodules | <i>Get the number of modules in a CEMiTool object</i> |
|----------|---|

---

**Description**

Get the number of modules in a CEMiTool object

**Usage**

```
nmodules(cem)

## S4 method for signature 'CEMiTool'
nmodules(cem)
```

**Arguments**

cem                    Object of class CEMiTool

**Value**

number of modules

**Examples**

```
# Get example CEMiTool object
data(cem)
# Get the number of modules
nmodules(cem)
```

---

|          |  |
|----------|--|
| ora_data | <i>Retrieve over representation analysis (ORA) results</i> |
|----------|--|

---

**Description**

Retrieve over representation analysis (ORA) results

**Usage**

```
ora_data(cem)

## S4 method for signature 'CEMiTool'
ora_data(cem)
```

**Arguments**

cem                    Object of class CEMiTool

## Details

This function returns the results of the `mod_ora` function on the `CEMiTool` object. The ID column corresponds to pathways in the `gmt` file for which genes in the modules were enriched. The Count column shows the number of genes in the module that are enriched for each pathway. The `GeneRatio` column shows the proportion of genes in the module enriched for a given pathway out of all the genes in the module enriched for any given pathway. The `BgRatio` column shows the proportion of genes in a given pathway out of all the genes in the `gmt` file. For more details, please refer to the `clusterProfiler` package documentation.

## Value

Object of class `data.frame` with ORA data

## References

Guangchuang Yu, Li-Gen Wang, Yanyan Han, Qing-Yu He. `clusterProfiler`: an R package for comparing biological themes among gene clusters. *OMICS: A Journal of Integrative Biology*. 2012, 16(5):284-287.

## Examples

```
# Get example CEMiTool object
data(cem)
# Read gmt file
gmt <- read_gmt(system.file('extdata', 'pathways.gmt',
                           package='CEMiTool'))
# Run module overrepresentation analysis
cem <- mod_ora(cem, gmt)
# Check results
head(ora_data(cem))
```

---

plot\_beta\_r2

*Soft-threshold beta selection graph*

---

## Description

Creates a graph showing each possible soft-threshold value and its corresponding R squared value

## Usage

```
plot_beta_r2(cem, ...)
```

## S4 method for signature 'CEMiTool'

```
plot_beta_r2(cem, plot_title = "Scale independence (beta selection)")
```

**Arguments**

|            |                           |
|------------|---------------------------|
| cem        | Object of class CEMiTool. |
| ...        | Optional parameters.      |
| plot_title | title of the graph        |

**Value**

Object of class CEMiTool with beta x R squared plot

**Examples**

```
# Get example CEMiTool object
data(cem)
# Plot scale-free model fit as a function of the soft-thresholding beta parameter choice
cem <- plot_beta_r2(cem)
# Check resulting plot
show_plot(cem, "beta_r2")
```

---

plot\_gsea

*GSEA visualization*

---

**Description**

Creates a heatmap with the results of gene set enrichment analysis (GSEA) of co-expression modules

**Usage**

```
plot_gsea(cem, ...)
```

## S4 method for signature 'CEMiTool'

```
plot_gsea(cem, pv_cut = 0.05)
```

**Arguments**

|        |                               |
|--------|-------------------------------|
| cem    | Object of class CEMiTool.     |
| ...    | Optional parameters.          |
| pv_cut | P-value cut-off. Default 0.05 |

**Value**

Object of class CEMiTool with GSEA plots

**Examples**

```
# Get example CEMiTool object
data(cem)
# Get example sample annotation file
# Run GSEA on network modules
cem <- mod_gsea(cem)
# Plot GSEA results
cem <- plot_gsea(cem)
# Check resulting plot
show_plot(cem, "gsea")
```

---

plot\_hist

*Plot histogram*

---

**Description**

This function plots a histogram of the distribution of gene expression, to help assess the normality of the data.

**Usage**

```
plot_hist(cem, ...)
```

## S4 method for signature 'CEMiTool'

```
plot_hist(cem, filter = FALSE)
```

**Arguments**

|        |   |
|--------|---|
| cem    | Object of class CEMiTool  |
| ...    | Optional parameters   |
| filter | Logical. Whether or not to use filtered data for CEMiTool objects (Default: FALSE). |

**Value**

Object of class CEMiTool containing expression histogram

**Examples**

```
# Get example CEMiTool object
data(cem)
# Plot histogram
cem <- plot_hist(cem)
# Check results
show_plot(cem, "hist")
```

---

plot\_interactions      *Network visualization*

---

### Description

Creates a graph based on interactions provided

### Usage

```
plot_interactions(cem, ...)  
  
## S4 method for signature 'CEMiTool'  
plot_interactions(cem, n = 10, ...)
```

### Arguments

|     |                           |
|-----|---------------------------|
| cem | Object of class CEMiTool. |
| ... | Optional parameters.      |
| n   | number of nodes to label  |

### Value

Object of class CEMiTool with profile plots

### Examples

```
# Get example CEMiTool object  
data(cem)  
# Get example gene interactions data  
int <- system.file("extdata", "interactions.tsv", package = "CEMiTool")  
int_df <- read.delim(int)  
# Include interaction data into CEMiTool object  
interactions_data(cem) <- int_df  
# Plot resulting networks  
cem <- plot_interactions(cem)  
# Check resulting plot  
show_plot(cem, "interaction")
```

---

|             |                                  |
|-------------|----------------------------------|
| plot_mean_k | <i>Network mean connectivity</i> |
|-------------|----------------------------------|

---

**Description**

Creates a graph showing the mean connectivity of genes in the network

**Usage**

```
plot_mean_k(cem, ...)  
  
## S4 method for signature 'CEMiTool'  
plot_mean_k(cem, title = "Mean connectivity")
```

**Arguments**

|       |                           |
|-------|---------------------------|
| cem   | Object of class CEMiTool. |
| ...   | Optional parameters.      |
| title | title of the graph        |

**Value**

Object of class CEMiTool with connectivity plot

**Examples**

```
# Get example CEMiTool object  
data(cem)  
# Plot scale-free model fit as a function of the soft-thresholding beta parameter choice  
cem <- plot_mean_k(cem)  
# Check resulting plot  
show_plot(cem, "mean_k")
```

---

|               |                               |
|---------------|-------------------------------|
| plot_mean_var | <i>Plot mean and variance</i> |
|---------------|-------------------------------|

---

**Description**

This plot returns a scatterplot of the mean by the variance of gene expression. A linear relationship between these values for RNAseq data suggest that an appropriate transformation such as the Variance Stabilizing Transformation should be applied.

**Usage**

```
plot_mean_var(cem, ...)

## S4 method for signature 'CEMiTool'
plot_mean_var(cem, filter = FALSE)
```

**Arguments**

|        |   |
|--------|---|
| cem    | Object of class CEMiTool  |
| ...    | Optional parameters   |
| filter | Logical. Whether or not to use filtered data for CEMiTool objects (Default: FALSE). |

**Value**

Object of class CEMiTool containing a mean and variance plot

**Examples**

```
# Get example CEMiTool object
data(cem)
# Plot mean and variance plot
cem <- plot_mean_var(cem)
# Check results
show_plot(cem, 'mean_var')
```

---

plot\_ora

*ORA visualization*

---

**Description**

Creates a bar plot with the results of module overrepresentation analysis

**Usage**

```
plot_ora(cem, ...)

## S4 method for signature 'CEMiTool'
plot_ora(cem, n = 10, pv_cut = 0.05, ...)
```

**Arguments**

|        |   |
|--------|---|
| cem    | Object of class CEMiTool.                     |
| ...    | parameters to plot_ora_single                 |
| n      | number of modules to show                     |
| pv_cut | p-value significance cutoff. Default is 0.05. |

**Value**

Object of class CEMiTool with ORA plots

**Examples**

```
# Get example CEMiTool object
data(cem)
# Read example gmt file
gmt <- read_gmt(system.file('extdata', 'pathways.gmt',
                           package='CEMiTool'))
# Run overrepresentation analysis
cem <- mod_ora(cem, gmt)
# Plot module gene expression profiles
cem <- plot_ora(cem)
# Check resulting plot
show_plot(cem, "ora")
```

---

|                 |   |
|-----------------|---|
| plot_ora_single | <i>ORA visualization for one module</i> |
|-----------------|---|

---

**Description**

ORA visualization for one module

**Usage**

```
plot_ora_single(
  es,
  ordr_by = "p.adjust",
  max_length = 50,
  pv_cut = 0.05,
  graph_color = "#4169E1",
  title = "Over Representation Analysis"
)
```

**Arguments**

|             |   |
|-------------|---|
| es          | a data.frame from ora function containing only one module |
| ordr_by     | column to order the data.frame                            |
| max_length  | max length of a gene set name                             |
| pv_cut      | p-value cutoff  |
| graph_color | color of bars   |
| title       | title of the graph  |

**Value**

a list with ggplot2 object and the number of significant gene sets

---

|              |   |
|--------------|---|
| plot_profile | <i>Expression profile visualization</i> |
|--------------|---|

---

## Description

Creates a plot with module gene expression profiles along samples

## Usage

```
plot_profile(cem, ...)  
  
## S4 method for signature 'CEMiTool'  
plot_profile(cem, order_by_class = TRUE, center_func = "mean")
```

## Arguments

|                |  |
|----------------|--|
| cem            | Object of class CEMiTool.  |
| ...            | Optional parameters.   |
| order_by_class | Logical. Only used if a sample annotation file is present. Whether or not to order by the class column in the sample annotation file (as defined by the class_column slot in cem). |
| center_func    | Character string indicating the centrality measure to show in the plot. Either 'mean' (the default) or 'median'.   |

## Value

Object of class CEMiTool with profile plots

## Examples

```
# Get example CEMiTool object  
data(cem)  
# Plot module gene expression profiles  
cem <- plot_profile(cem)  
# Check resulting plot  
show_plot(cem, "profile")
```

---

|         |                                    |
|---------|------------------------------------|
| plot_qq | <i>Plot quantile-quantile plot</i> |
|---------|------------------------------------|

---

**Description**

This function creates a normal QQ plot of the expression values.

**Usage**

```
plot_qq(cem, ...)  
  
## S4 method for signature 'CEMiTool'  
plot_qq(cem, filter = FALSE)
```

**Arguments**

|        |   |
|--------|---|
| cem    | Object of class CEMiTool  |
| ...    | Optional parameters   |
| filter | Logical. Whether or not to use filtered data for CEMiTool objects (Default: FALSE). |

**Value**

Object of class CEMiTool containing qqplot

**Examples**

```
# Get example CEMiTool object  
data(cem)  
# Plot quantile-quantile plot  
cem <- plot_qq(cem)  
# Check results  
show_plot(cem, 'qq')
```

---

|                  |                          |
|------------------|--------------------------|
| plot_sample_tree | <i>Sample clustering</i> |
|------------------|--------------------------|

---

**Description**

Creates a dendrogram showing the similarities between samples in the expression data.

**Usage**

```
plot_sample_tree(cem, ...)

## S4 method for signature 'CEMiTool'
plot_sample_tree(
  cem,
  col_vector = NULL,
  sample_name_column = NULL,
  class_column = NULL,
  filter = FALSE
)
```

**Arguments**

|                                 |  |
|---------------------------------|--|
| <code>cem</code>                | Object of class CEMiTool or <code>data.frame</code> .  |
| <code>...</code>                | Optional parameters.   |
| <code>col_vector</code>         | A vector of columns to use for visualizing the clustering. See Details.  |
| <code>sample_name_column</code> | A string specifying the column to be used as sample identification. For CEMiTool objects, this will be the string specified in the <code>sample_name_column</code> slot. |
| <code>class_column</code>       | A string specifying the column to be used as sample group identification. For CEMiTool objects, this will be the string specified in the <code>class_column</code> slot. |
| <code>filter</code>             | Logical. Whether or not to use filtered data for CEMiTool objects (Default: FALSE).  |

**Value**

Object of class CEMiTool with dendrogram or a plot object.

**Examples**

```
# Get example CEMiTool object
data(cem)
# Plot sample dendrogram
cem <- plot_sample_tree(cem)
# Check resulting plot
show_plot(cem, "sample_tree")
```

---

read\_gmt

*Read a GMT file*

---

**Description**

Read a GMT file

**Usage**

```
read_gmt(fname)
```

**Arguments**

fname            GMT file name.

**Value**

A list containing genes and description of each pathway

**Examples**

```
# Read example gmt file
gmt_fname <- system.file("extdata", "pathways.gmt", package = "CEMiTool")
gmt_in <- read_gmt(gmt_fname)
```

---

|              |  |
|--------------|--|
| sample_annot | <i>Yellow Fever Sample Annotation data</i> |
|--------------|--|

---

**Description**

Modified data from a yellow fever vaccination study by Querec et al, 2009. This dataset, together with expr can be used as input for CEMiTool functions

**Usage**

```
data(sample_annot)
```

**Format**

An object of class data.frame

**Source**

[GEO](#)

**References**

Querec TD, Akondy RS, Lee EK, Cao W et al. Systems biology approach predicts immunogenicity of the yellow fever vaccine in humans. Nat Immunol 2009 Jan;10(1):116-25. PMID: 19029902  
[PubMed](#)

**Examples**

```
data(expr)
data(sample_annot)
# Run CEMiTool analysis
## Not run: cemitool(expr, sample_annot)
```

---

sample\_annotation      *Retrive or set the sample\_annotation attribute*

---

## Description

Retrive or set the sample\_annotation attribute

## Usage

```
sample_annotation(cem)

## S4 method for signature 'CEMiTool'
sample_annotation(cem)

sample_annotation(
  cem,
  sample_name_column = "SampleName",
  class_column = "Class"
) <- value

## S4 replacement method for signature 'CEMiTool'
sample_annotation(
  cem,
  sample_name_column = "SampleName",
  class_column = "Class"
) <- value
```

## Arguments

|                    |   |
|--------------------|---|
| cem                | Object of class CEMiTool  |
| sample_name_column | A string containing the name of a column which should be used as a unique identifier for samples in the file. Only used when assigning a sample annotation data.frame. Default: "SampleName". |
| class_column       | A string containing the name of a column which should be used to identify different sample groups. Only used when assigning a sample annotation data.frame. Default: "Class"                  |
| value              | A data.frame containing the sample annotation, should have at least two columns containing the Class and the Sample Name that should match with samples in expression                         |

## Value

A data.frame containing characteristics of each sample.

**Examples**

```

# Get example expression data
data(expr0)
# Get example sample_annotation data
data(sample_annot)
# Initialize CEMiTool object with expression
cem <- new_cem(expr0)
# Add sample annotation file to CEMiTool object
sample_annotation(cem,
  sample_name_column="SampleName",
  class_column="Class") <- sample_annot
# Check annotation
head(sample_annotation(cem))

```

---

save\_plots

*Save CEMiTool object plots*

---

**Description**

Save plots into the directory specified by the directory argument.

**Usage**

```

save_plots(cem, ...)

## S4 method for signature 'CEMiTool'
save_plots(
  cem,
  value = c("all", "profile", "gsea", "ora", "interaction", "beta_r2", "mean_k",
    "sample_tree", "mean_var", "hist", "qq"),
  force = FALSE,
  directory = "./Plots"
)

```

**Arguments**

|           |  |
|-----------|--|
| cem       | Object of class CEMiTool.  |
| ...       | Optional parameters One of "all", "profile", "gsea", "ora", "interaction", "beta_r2", "mean_k", "sample_tree", "mean_var", "hist", "qq". |
| value     | A character string containing the name of the plot to be saved.  |
| force     | If the directory exists, execution will not stop.  |
| directory | Directory into which the files will be saved.  |

**Value**

A pdf file or files with the desired plot(s)

**Examples**

```
# Get example CEMiTool object
data(cem)
# Plot beta x R squared graph
cem <- plot_beta_r2(cem)
# Save plot
## Not run: save_plots(cem, value="beta_r2", directory="./Plots")
```

---

|                           |                                       |
|---------------------------|---------------------------------------|
| <code>select_genes</code> | <i>Select genes based on variance</i> |
|---------------------------|---------------------------------------|

---

**Description**

Select genes based on variance

**Usage**

```
select_genes(expr, n_genes, filter_pval = 0.1)
```

**Arguments**

|                          |   |
|--------------------------|---|
| <code>expr</code>        | A data.frame containing expression values |
| <code>n_genes</code>     | (Optional) Number of genes to be selected |
| <code>filter_pval</code> | P-value cutoff for gene selection         |

**Value**

A vector containing the names of selected genes

**Examples**

```
# Get example expression data
data(expr0)
# Filter genes
expr_f <- filter_genes(expr0)
# Check selected genes
expr_f[1:5, 1:5]
# Filter genes and apply variance stabilizing transformation
expr_f2 <- filter_genes(expr0, apply_vst=TRUE)
# Check results
expr_f2[1:5, 1:5]
# Selected genes
selected <- select_genes(expr_f2)
# Get data.frame with only selected genes
expr_s <- expr_f2[selected, ]
# Check results
expr_s[1:5, 1:5]
```

---

show,CEMiTool-method    *Print a cemitool object*

---

### Description

Print a cemitool object

### Usage

```
## S4 method for signature 'CEMiTool'
show(object)
```

### Arguments

object                    Object of class CEMiTool

### Value

A CEMiTool object.

---

show\_plot                    *Retrieve CEMiTool object plots*

---

### Description

Retrieve CEMiTool object plots

### Usage

```
show_plot(cem, value)

## S4 method for signature 'CEMiTool'
show_plot(
  cem,
  value = c("profile", "gsea", "ora", "interaction", "beta_r2", "mean_k",
            "sample_tree", "mean_var", "hist", "qq")
)
```

### Arguments

cem                        Object of class CEMiTool.

value                     A character string containing the name of the plot to be shown. One of "profile", "gsea", "ora", "interaction", "beta\_r2", "mean\_k", "sample\_tree", "mean\_var", "hist", "qq".

**Value**

A plot corresponding to a CEMiTool analysis

**Examples**

```
# Get example CEMiTool object
data(cem)
# Plot beta x R squared graph
cem <- plot_beta_r2(cem)
# Check plot
show_plot(cem, "beta_r2")
```

---

vst

*Perform variance stabilizing transformation on expression file.*

---

**Description**

Perform variance stabilizing transformation on expression file.

**Usage**

```
vst(expr)
```

**Arguments**

expr                    expression file containing genes in the rows and samples in the columns

**Value**

A data.frame containing the results.

---

write\_files

*Save the CEMiTool object in files*

---

**Description**

Save the CEMiTool object in files

**Usage**

```
write_files(cem, ...)
```

```
## S4 method for signature 'CEMiTool'
write_files(cem, directory = "./Tables", force = FALSE)
```

**Arguments**

|                        |   |
|------------------------|---|
| <code>cem</code>       | Object of class <code>CEMiTool</code>               |
| <code>...</code>       | Optional parameters                                 |
| <code>directory</code> | a directory   |
| <code>force</code>     | if the directory exists the execution will not stop |

**Value**

A directory containing `CEMiTool` results in files.

**Examples**

```
# Get example CEMiTool object
data(cem)
# Save CEMiTool results in files
write_files(cem, directory=".", force=TRUE)
```
