

Package ‘alabaster.spatial’

January 19, 2026

Title Save and Load Spatial 'Omics Data to/from File

Description Save SpatialExperiment objects and their images into file artifacts, and load them back into memory.

This is a more portable alternative to serialization of such objects into RDS files.

Each artifact is associated with metadata for further interpretation; downstream applications can enrich this metadata with context-specific properties.

Version 1.10.0

Date 2024-11-09

License MIT + file LICENSE

Depends SpatialExperiment, alabaster.base

Imports methods, utils, grDevices, S4Vectors, alabaster.sce, rhdf5

Suggests testthat, knitr, rmarkdown, BiocStyle, DropletUtils, magick, png, digest

VignetteBuilder knitr

RoxygenNote 7.3.2

biocViews DataImport, DataRepresentation

| | |
|------------------|-----------------------------|
| loadSpatialImage | <i>Load a spatial image</i> |
|------------------|-----------------------------|

Description

Load an image as a [SpatialImage](#) or subclass thereof.

Usage

```
loadSpatialImage(img.info, project)
```

Arguments

| | |
|----------|--|
| img.info | Named list containing the metadata for this assay. |
| project | Object specifying the project of interest. |

Value

A [SpatialImage](#) containing the image data (or a reference to it).

Author(s)

Aaron Lun

Examples

```
example(read10xVisium, echo=FALSE)
img <- imgData(spe)$data[[1]]

tmp <- tempfile()
dir.create(tmp)
meta <- stageObject(img, tmp, "whee")

out <- loadSpatialImage(meta, tmp)
```

| | |
|-----------------------|---|
| readSpatialExperiment | <i>Read a SpatialExperiment from disk</i> |
|-----------------------|---|

Description

Read a [SpatialExperiment](#) object from its on-disk representation.

Usage

```
readSpatialExperiment(path, metadata, ...)
```

Arguments

| | |
|----------|--|
| path | String containing a path to a directory, itself created using the <code>saveObject</code> method for <code>SpatialExperiment</code> objects. |
| metadata | Named list of metadata for this object, see <code>readObjectFile</code> for details. |
| ... | Further arguments passed to <code>readSingleCellExperiment</code> and internal <code>altReadObject</code> calls. |

Value

A `SpatialExperiment` object.

Author(s)

Aaron Lun

See Also

`"saveObject, SpatialExperiment-method"`, to save a `SpatialExperiment` to disk.

Examples

```
library(SpatialExperiment)
example(read10xVisium, echo=FALSE)

tmp <- tempfile()
saveObject(spe, tmp)
readObject(tmp)
```

`saveObject, SpatialExperiment-method`
Save a spatial experiment

Description

Save a `SpatialExperiment` object to its on-disk representation.

Usage

```
## S4 method for signature 'SpatialExperiment'
saveObject(x, path, ...)
```

Arguments

| | |
|------|---|
| x | A <code>SpatialExperiment</code> object. |
| path | String containing the path to a directory in which to save x. |
| ... | Additional named arguments to pass to specific methods. |

Details

Currently, only PNG and TIFF image formats are supported in the `imgData`. All other images will be re-saved as PNG.

Value

`x` is saved to `path` and `NULL` is invisibly returned.

Author(s)

Aaron Lun

See Also

[readSpatialExperiment](#), to read the `SpatialExperiment` back into the R session.

Examples

```
library(SpatialExperiment)
example(read10xVisium, echo=FALSE)

tmp <- tempfile()
saveObject(spe, tmp)
list.files(tmp, recursive=TRUE)
```

`stageSpatialImage` *Stage images for upload*

Description

These methods are deprecated and are only documented here for back-compatibility purposes.

Usage

```
## S4 method for signature 'VirtualSpatialImage'
stageObject(x, dir, path, child = FALSE, ...)

## S4 method for signature 'StoredSpatialImage'
stageObject(x, dir, path, child = FALSE, ...)

## S4 method for signature 'RemoteSpatialImage'
stageObject(x, dir, path, child = FALSE, ...)
```

Arguments

| | |
|--------------------|--|
| <code>x</code> | A SpatialImage object. |
| <code>dir</code> | String containing a path to a directory. |
| <code>path</code> | String containing a relative path inside a directory. |
| <code>child</code> | Logical scalar indicating whether <code>x</code> is a child of another object. |
| <code>...</code> | Further arguments, ignored. |

Details

Each of the different methods will take advantage of any existing files to avoid an actual save. For example, the [RemoteSpatialImage](#) method will download the file directly to path, while the [StoredSpatialImage](#) method will create a link or copy the file. The [SpatialImage](#) method will fall back to saving the raster directly as a PNG.

Value

An image file is created at `file.path(dir, path)`, possibly after appending an appropriate file extension.

The return value should be a named list containing at least:

- `$schema`, a string specifying the schema to use to validate the metadata. This may have a `package` attribute to specify the package where the schema lives (in its `inst/schemas` directory).
- `path`, a string containing the path to the file containing the assay contents. This should start with the input path but can be followed by any necessary file extensions.
- `child`, whether this is a child resource of a larger object.

Other fields can be provided and will be included in the metadata, provided that they are recognized by the specified schema.

Aaron Lun

Examples

```
example(read10xVisium, echo=FALSE)
(img <- imgData(spe)$data[[1]])

# Doing a local run:
tmp <- tempfile()
dir.create(tmp)
stageObject(img, tmp, "whee")

# Forcing a re-save:
Y <- as(img, "LoadedSpatialImage")
stageObject(Y, tmp, "foo")
```
