Package 'Guitar'

January 24, 2026

Type Package

Title Guitar

Version 2.27.0

Date 2019-04-26

Author Xiao Du, Hui Liu, Lin Zhang, Jia Meng

Maintainer Jia Meng <jia.meng@xjtlu.edu.cn>

Description The package is designed for visualization
of RNA-related genomic features with respect to the landmarks of RNA transcripts, i.e.,
transcription starting site, start codon, stop codon and transcription ending site.

Contents

GRangesListmapToTranscripts

GRangesListmapToTranscripts

Description

Map the input data to the transcript and select the data with a length equal to the length of the site when entering the data.

Usage

```
GRangesListmapToTranscripts(site,
                            mapFilterTranscript = FALSE,
                            transcripts)
```

Arguments

site   A GRangeslist object, the content of the sites information.

mapFilterTranscript
                    Whether to filter the length of transcripts equal the original site. Default: FALSE.

transcripts   A type of transcripts from the Guitartxdb.

Value

A GRangeslist object, the content is the site data filtered by the mapping.

Examples

```
# read transcript information and generate guitartxdb.
txdb_file <- system.file("extdata", "mm10_toy.sqlite", package="Guitar")
txdb <- loadDb(txdb_file)
guitarTxdb <- makeGuitarTxdb(txdb)

#read the gene feature file.
stBedFile <- system.file("extdata", "m6A_mm10_exomePeak_1000peaks_bed12.bed", package="Guitar")
site <-  blocks(import(stBedFile))
sitesGRanges <- GRangesListmapToTranscripts(site, mapFilterTranscript = FALSE,transcripts = guitarTxdb$tx$tx)
```

GuitarPlot *GuitarPlot*

Description

Plot the transcriptomic distribution of genomic features

Usage

```
GuitarPlot(txGTF = NULL,
            txGFF = NULL,
            txGenomeVer = NULL,
            txTxdb = NULL,
            txGuitarTxdb = NULL,
            txGuitarTxdbSaveFile = NA,
            stBedFiles = NULL,
            stGRangeLists = NULL,
            stGroupName = NULL,
            stAmblguity = 5,
            stSampleNum = 10,
            stSampleModle = "Equidistance",
            #stSampleModle = "random",
            txfiveutrMinLength = 100,
            txcdsMinLength = 100,
            txthreeutrMinLength = 100,
            txlongNcrnaMinLength = 100,
            txlncrnaOverlapmrna = FALSE,
            txpromoterLength = 1000,
            txtailLength = 1000,
            txAmblguity = 5,
            txPrimaryOnly = FALSE,
            txTxComponentProp = NULL,
            txMrnaComponentProp = NULL,
            txLncrnaComponentProp = NULL,
            mapFilterTranscript = TRUE,
            headOrtail = TRUE,
            enableCI = TRUE,
            pltTxType =  c("tx","mrna","ncrna"),
            overlapIndex = 1,
            siteLengthIndex = 1,
            adjust = 1,
            CI_ResamplingTime = 1000,
            CI_interval = c(0.025,0.975),
            miscOutFilePrefix = NA)
```

Arguments

`txGTF`	GTF file as a source of transcripts.
`txGFF`	txGFF file as a source of transcripts.
`txGenomeVer`	Allows direct provision of genomic assembly numbers, such as "hg19", which is automatically downloaded from makeTxDbFromUCSC.
`txTxdb`	txTxdb file as a source of transcripts.
`txGuitarTxdb`	The processed GuitarCoordinate is used as the source of the transcriptome.
`txGuitarTxdbSaveFile`	
	Return the generated GuitarTxdb to a file.
`stBedFiles`	BED file as a source of Site.
`stGRangeLists`	GRange data structure as a source of Site.
`stGroupName`	Group names of Sites.
`stAmblguity`	Maximum overlap between sites. Default: 5.
`stSampleNum`	The number of bases sampled at each Site. Default: 3.
`stSampleModle`	sampling "Equidistance",sampling "random". Default:"Equidistance".
`txfiveutrMinLength`	
	5'UTR length. Default: 100.
`txcdsMinLength`	CDS length. Default: 100.
`txthreeutrMinLength`	
	3'UTR length. Default: 100.
`txlongNcrnaMinLength`	
	lncrna length. Default: 100.
`txlncrnaOverlapmrna`	
	Whether to allow lncRNA to overlap with mRNA. Default: FALSE.
`txpromoterLength`	
	promoter length. Default: 1000.
`txtailLength`	tail length. Default: 1000.
`txAmblguity`	Maximum overlap between Tx. Default: 5.
`txPrimaryOnly`	Whether to use only the main Tx. Default: FALSE.
`txTxComponentProp`	
	If it is "NULL", the proportion of the promoter/tx/tail of TX is automatically calculated according to the transcriptome, otherwise, the user specifies the proportion of each part.
`txMrnaComponentProp`	
	If it is "NULL", the proportion of promoter/5'UTR/CDS/3'UTR/tail of mrna is automatically calculated according to the transcriptome. Otherwise, the user specifies the proportion of each part.
`txLncrnaComponentProp`	
	If it is "NULL", the proportion of promoter/tx/tail of lncRNA is automatically calculated according to the transcriptome, otherwise the user specifies the proportion of each part.

mapFilterTranscript

> Whether to filter the length of transcripts equal the original site. Default: TRUE.

headOrtail   Whether to retain promoter and tail. Default: TRUE.

enableCI   Whether to add a CI curve. Default: TRUE.

pltTxType   Which transcript is to be drawn on. If there is no such transcript in the genome, it cannot be drawn even if specified. Default: c("tx","mrna","ncrna").

overlapIndex   Index of site overlapping times. Default: 1.

siteLengthIndex

> Index of site length. Default: 1.

CI_ResamplingTime

> Resampling times in density drawing mode. Default: 1000.

CI_interval   Upper and lower limits of the confidence interval. Default : c(0.025,0.975).

adjust   Curve's smooth level. Default: 1.

miscOutFilePrefix

> Save as a PDF name prefix, If the prefix is not specified, we will default the PDF name to "Guitar-type-test.PDF".

Details

This function plots the transcriptomic distribution of genomic features. It is designed for a fast usage of the Guitar package, When you need to specify a parameter, you need to define the function when the package is called.

Value

A figure showing the transcriptomic distribution of the genomic features will be generated. Post-editing with Adobe Illustrator or other graphic software is recommended.

Author(s)

Xiao Du <xiao.du@cumt.edu.cn>

Examples

```
# read transcript information
txdb_file <- system.file("extdata", "mm10_toy.sqlite", package="Guitar")
txdb <- loadDb(txdb_file)
# read genomic features
stGRangelist<-list()
stBedFiles <- list(system.file("extdata", "m6A_mm10_exomePeak_1000peaks_bed12.bed", package="Guitar"))
for (i in 1:length(stBedFiles)) {
  stGRangelist[[i]] <-  blocks(import(stBedFiles[[i]]))
}
#plot
GuitarPlot(txTxdb = txdb,
                stGRangeLists = stGRangelist,
                stGroupName = c("Group1"))
```

---

makeGuitarTxdb   *makeGuitarTxdb*

Description

Make a Guitar Coordinates from TranscriptDb object, i.e., making Guitar coordinates for 3 differ-ent type, including, tx, mRNA, lncRNA, tx include three component, Pomoter,RNA, Tail, mRNA include five component, Pomoter, 5'UTR, CDS, 3'UTR, Tail, lncRNA include three component, Pomoter, ncRNA, Tail. Additional filters will discard transcripts that are too short or has too much ambigous on Genome to increase the sensitivity of the analysis.

Usage

```
makeGuitarTxdb(txdb,
                txfiveutrMinLength = 100,
                txcdsMinLength = 100,
                txthreeutrMinLength = 100,
                txlongNcrnaMinLength = 100,
                txlncrnaOverlapmrna = FALSE,
                txpromoterLength = 1000,
                txtailLength = 1000,
                txAmblguity = 5,
                txTxComponentProp = NULL,
                txMrnaComponentProp = NULL,
                txLncrnaComponentProp = NULL,
                txPrimaryOnly = FALSE,
                pltTxType = c("tx","mrna","ncrna"),
                withTxContext = TRUE
                )
```

Arguments

txdb   A transcriptDb object, which can be generated from makeTxDbFromUCSC or
                      other functions.

txfiveutrMinLength
                      5'UTR simulation length. Unfortunately, the 5'UTR length of some mRNAs
                      does not provide an effective resolution for analysis. These mRNAs will be
                      filtered out of the analysis. Default: 100.

txcdsMinLength CDS simulation length. Unfortunately, the CDS length of some mRNAs does
                      not provide an effective resolution for analysis. These mRNAs will be filtered
                      out of the analysis. Default: 100.

txthreeutrMinLength
                      3'UTR simulation length. Unfortunately, the 3'UTR length of some mRNAs
                      does not provide an effective resolution for analysis. These mRNAs will be
                      filtered out of the analysis. Default: 100.

txlongNcrnaMinLength

non-coding RNAs with length smaller than this value will not be used in the
analysis.

txlncrnaOverlapmrna

Whether to allow lncRNA to overlap with mRNA. Default: FALSE.

txpromoterLength

promoter simulator length. Default: 1000.

txtailLength   tail simulator length. Default: 1000.

txAmblguity   If a transcript overlap with more number of transcripts than this number, this
transcript will be used in the analysis. By filtering out a number of transcripts,
this filter also decrease memory usage and computation time. Default: 5.

txTxComponentProp

If it is "NULL", the proportion of the promoter/tx/tail of TX is automatically
calculated according to the transcriptome, otherwise, the user specifies the pro-
portion of each part.

txMrnaComponentProp

If it is "NULL", the proportion of promoter/5'UTR/CDS/3'UTR/tail of mrna
is automatically calculated according to the transcriptome. Otherwise, the user
specifies the proportion of each part.

txLncrnaComponentProp

If it is "NULL", the proportion of promoter/tx/tail of lncRNA is automatically
calculated according to the transcriptome, otherwise the user specifies the pro-
portion of each part.

txPrimaryOnly   Whether to use only the main Tx. Default: TRUE.

pltTxType   Which transcript is to be drawn on. If there is no such transcript in the genome,
it cannot be drawn even if specified. Default: c("tx","mrna","ncrna").

withTxContext   Whether to add an extended area to the transcript.

Value

A Guitar coordiantes (GRanges object) will be returned, with 3 different type, with Transcript ID,
the relative position of each GRanges on the RNA transcript, the interval (bp) between different
coordiantes on a transcript component.

Author(s)

Xiao Du <xiao.du@cumt.edu.cn>

Examples

```
# read transcript information
txdb_file <- system.file("extdata", "mm10_toy.sqlite", package="Guitar")
txdb <- loadDb(txdb_file)
guitarTxdb <- makeGuitarTxdb(txdb)
```

---

normalize   *normalize*

Description

This function Comparing the sampled site with the normalized guitar coordinate system to find the relative position of each site in the zero to one coordinate system, and calculating the weight of each site at this position.

Usage

```
normalize(sitesGRanges,
          guitarTxdb,
          txType,
          overlapIndex,
          siteLengthIndex)
```

Arguments

sitesGRanges	A kind of GRange object, generated by sampling the site.
guitarTxdb	Sites mapping on guitartxdb and finding the corresponding location on the transcript.
txType	Transcript type comparing with guitar coordinate's transcript type.
overlapIndex	Index of site overlapping times. Default: 1.
siteLengthIndex	
	Index of site length. Default: 1.

Value

A data list object contains two types of data information, one is the location information of the site, and the other is the weight information of the site.

Author(s)

Xiao Du<xiao.du@cumt.edu.cn>

Examples

```
# read genomic features
stBedFile <- system.file("extdata", "m6A_mm10_exomePeak_1000peaks_bed12.bed", package="Guitar")
site <-  blocks(import(stBedFile))
# read transcript information
txdb_file <- system.file("extdata", "mm10_toy.sqlite", package="Guitar")
txdb <- loadDb(txdb_file)
guitarTxdb <- makeGuitarTxdb(txdb)
sitesGRanges <- samplePoints(list(site),
                             stSampleNum = 5,
```

```
                                stAmblguity = 5,
                                pltTxType = c("mrna"),
                                stSampleModle = "Equidistance",
                                mapFilterTranscript = FALSE,
                                guitarTxdb)
    sitesNormlize <- normalize(sitesGRanges,
                                guitarTxdb,
                                txType = "mrna",
                                overlapIndex = 1,
                                siteLengthIndex = 1)
```

---

samplePoints   *samplePoints*

Description

This function calculates the length of each sites and then samples the points from sites by using two sampling methods based on the number of sampling points. One sampling method is equidistant sampling, the N sampling points are sampled at equal intervals according to the length of the site. Another method is random sampling, and N sampling points are randomly distributed on the site.

Usage

```
samplePoints(sitesGrangelists,
            stSampleNum = 5,
            stAmblguity = 5,
            pltTxType = c("tx","mrna","ncrna"),
            stSampleModle = "Equidistance",
            mapFilterTranscript = FALSE,
            guitarTxdb)
```

Arguments

sitesGrangelists

A GRangeslist object, the content of the sites information.

stSampleNum   The number of bases sampled at each Site. Default: 3.

stAmblguity   Maximum overlap between sites. Default: 5.

pltTxType   Transcript type mapped to guitartxdb.

stSampleModle   sampling "Equidistance",sampling "random". Default:"Equidistance".

mapFilterTranscript

Whether to filter the length of transcripts equal the original site. Default: FALSE.

guitarTxdb   Sites mapping on guitartxdb and finding the corresponding location on the transcript.

Value

A GRange data list, the content of the list is the sampling point, the width is 1, the total number of data is N times the input data.

Author(s)

Xiao Du<xiao.du@cumt.edu.cn>

Examples

```
# read genomic features
stBedFile <- system.file("extdata", "m6A_mm10_exomePeak_1000peaks_bed12.bed", package="Guitar")
site <-  blocks(import(stBedFile))
#generate GuitarTxdb
txdb_file <- system.file("extdata", "mm10_toy.sqlite", package="Guitar")
txdb <- loadDb(txdb_file)
guitarTxdb <- makeGuitarTxdb(txdb)
# sample site points
sitesPoints <- samplePoints(list(site),
                            stSampleNum = 5,
                            stAmblguity = 5,
                            pltTxType = c("tx","mrna","ncrna"),
                            stSampleModle = "Equidistance",
                            mapFilterTranscript = FALSE,
                            guitarTxdb)
```
