

# Package ‘ivygapSE’

January 24, 2026

**Title** A SummarizedExperiment for Ivy-GAP data  
**Description** Define a SummarizedExperiment and exploratory app for Ivy-GAP glioblastoma image, expression, and clinical data.  
**Version** 1.33.0  
**Author** Vince Carey  
**Suggests** knitr, png, limma, grid, DT, randomForest, digest, testthat, rmarkdown, BiocStyle, magick, statmod, codetools  
**Depends** R (>= 3.5.0), SummarizedExperiment  
**Imports** shiny, survival, survminer, hwriter, plotly, ggplot2, S4Vectors, graphics, stats, utils, UpSetR  
**Maintainer** VJ Carey <stvjc@channing.harvard.edu>  
**License** Artistic-2.0  
**LazyLoad** yes  
**biocViews** Transcription, Software, Visualization, Survival, GeneExpression, Sequencing  
**RoxygenNote** 7.2.3  
**VignetteBuilder** knitr  
**git\_url** <https://git.bioconductor.org/packages/ivygapSE>  
**git\_branch** devel  
**git\_last\_commit** e007a21  
**git\_last\_commit\_date** 2025-10-29  
**Repository** Bioconductor 3.23  
**Date/Publication** 2026-01-23

---

|                |                               |
|----------------|-------------------------------|
| designOverview | <i>render design overview</i> |
|----------------|-------------------------------|

---

**Description**

- render design overview
- render anatomic nomenclature

**Usage**

- designOverview()
- nomenclat()

**Value**

- a rastergrob grob

**Examples**

- designOverview()

---

|            |                                                                                           |
|------------|-------------------------------------------------------------------------------------------|
| exprByType | <i>simple plot of expression values by structure/expression-based selection in IvyGAP</i> |
|------------|-------------------------------------------------------------------------------------------|

---

**Description**

- simple plot of expression values by structure/expression-based selection in IvyGAP

**Usage**

- exprByType(sym, ...)

**Arguments**

- sym           a gene symbol found among ‘rownames(ivySE)’
- ...           passed to plot, exclusive of ylab, xlab, axes

**Value**

invisibly returns a list with two elements: `exprs`, the vector of expression values, and `types`, the vector of structure types

**Examples**

```
exprByType("MYC")
```

---

|                          |                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------|
| <code>getRefLimma</code> | <i>provide access to a limma analysis of RNA-seq profiles for reference histology samples</i> |
|--------------------------|-----------------------------------------------------------------------------------------------|

---

**Description**

provide access to a limma analysis of RNA-seq profiles for reference histology samples

**Usage**

```
getRefLimma()
```

**Value**

an instance of [MArrayLM-class](#) representing regularized gene-wise ANOVAs

**Note**

Uses [download.file](#) to acquire RDS of the output of [eBayes](#) from a public S3 bucket. The limma model was fit using [duplicateCorrelation](#) to address multiplicity of contributions per donor. Comparisons are to samples labeled CT-reference (cellular tumor, reference contributions), with coefficients 2-5 corresponding to CT-mvp (microvascular proliferation), CT-pan (pseudopalisading cells around necrosis), IT (infiltrating tumor), and LE (leading edge), respectively.

**Examples**

```
requireNamespace("limma")
ebout = getRefLimma() # is result of eBayes
colnames(ebout$coef)
limma::topTable(ebout,2)
```

---

|            |                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------|
| ivyGlimpse | <i>simple app to explore image property quantifications in relation to survival and expression</i> |
|------------|----------------------------------------------------------------------------------------------------|

---

**Description**

simple app to explore image property quantifications in relation to survival and expression

**Usage**

```
ivyGlimpse()
```

**Value**

Side effect of starting the app only.

**Examples**

```
if (interactive()) print(ivyGlimpse())
```

---

|       |                                                                             |
|-------|-----------------------------------------------------------------------------|
| ivySE | <i>ivySE: SummarizedExperiment for IvyGAP expression data and meta-data</i> |
|-------|-----------------------------------------------------------------------------|

---

**Description**

ivySE: SummarizedExperiment for IvyGAP expression data and metadata

**Usage**

```
ivySE
```

**Format**

SummarizedExperiment instance

**Details**

Archive: gene\_expression\_matrix\_2014-11-25.zip

makeGeneSets

*demonstration of gene set construction for ivyGlimpse app*

---

**Description**

demonstration of gene set construction for ivyGlimpse app

**Usage**

```
makeGeneSets()
```

**Value**

list of gene sets with attributes facilitating dropdown construction – attr(,"fullTitle") is a list of strings associated with gene set elements (named list with vectors of gene symbols constituting sets of interest)

List of 4

\$ General: Ras-Raf-MEK-Erk/JNK signaling (26 genes)

: chr [1:26] "KRAS" "HRAS" "BRAF" "RAF1" ...

\$ Glioblastoma: RTK/Ras/PI3K/AKT Signaling (17 genes)

: chr [1:17] "EGFR" "ERBB2" "PDGFRA" "MET" ...

\$ General: PI3K-AKT-mTOR signaling (17 genes)

: chr [1:17] "PIK3CA" "PIK3R1" "PIK3R2" "PTEN" ...

\$ Ovarian Cancer: Putative tumor-suppressor genes in epithelial ovarian cancer (16 genes)

: chr [1:16] "DIRAS3" "RASSF1" "DLEC1" "SPARC" ...

- attr(\*, "fullTitle")=List of 4

..\$ glioRTK : chr "Glioblastoma: RTK/Ras/PI3K/AKT Signaling (17 genes)"

..\$ pi3k : chr "General: PI3K-AKT-mTOR signaling (17 genes)"

..\$ ovtumsupp: chr "Ovarian Cancer: Putative tumor-suppressor genes in epithelial ovarian cancer (16 genes)"

..\$ rasraf : chr "General: Ras-Raf-MEK-Erk/JNK signaling (26 genes)"

**Note**

Should be replaced by selections from a general catalog.

**Examples**

```
str(makeGeneSets())
```

---

tumorDetails

*helper functions for data access*

---

**Description**

helper functions for data access

**Usage**

```
tumorDetails(se)
```

```
subBlockDetails(se)
```

```
vocab()
```

**Arguments**

`se` SummarizedExperiment instance, intended to work for ivySE in this package

**Value**

data.frames for tumorDetails, subBlockDetails and vocab

**Examples**

```
data(ivySE)
dim(tumorDetails(ivySE))
```
