Details

The rows of a [BSData](#) object represent ranges (in genomic coordinates) of interest. The [GRanges](#) and [GRangesList](#) classes contains sequence (e.g., chromosome) name, genomic coordinates, and strand information. Each range can be annotated with additional data; this data might be used to describe the range or to summarize results (e.g., statistics of differential abundance) relevant to the range. Rows may or may not have row names; they often will not.

data

data

Description

A part of BS-Seq data for three cell type: WGBS data were derived from whole blood collected on a cohort of healthy individuals from Sweden. Cell lines were separated into T-cells (19 samples), monocytes (13 samples) and B-cells (8 samples). Sequencing was performed on the Illumina HiSeq2000/2500 system for each of the 40 samples, separately. For illustration only 3 samples each containing 30,440 CpG sites around BLK gene are provided here. The whole data are analyzed in the cited paper.

Format

BED files

Details

The data is part of whole blood from Sweden.

manhattanDMCs-method *manhattanDMCs method*

Description

Creates a Manhattan plot based on the p-values obtained from `findDMCs` method

Usage

```
manhattanDMCs(object, col, chrlabs, suggestiveline, genomewideline, highlight,
  logp, annotatePval, annotateTop, ...)
```

```
## S4 method for signature 'BSDMCs'
manhattanDMCs(object, col, chrlabs, suggestiveline,
  genomewideline, highlight, logp, annotatePval, annotateTop, ...)
```

Arguments

<code>object</code>	A <code>BSDData-class</code> or <code>BSDMCs-class</code> object
<code>col</code>	A character vector indicating which colors to alternate.
<code>chrlabs</code>	A character vector equal to the number of chromosomes specifying the chromosome labels (e.g., <code>c(1:22, "X", "Y", "MT")</code>).
<code>suggestiveline</code>	Where to draw a "suggestive" line. Default $-\log_{10}(1e-5)$. Set to <code>FALSE</code> to disable.
<code>genomewideline</code>	Where to draw a "genome-wide significant" line. Default $-\log_{10}(5e-8)$. Set to <code>FALSE</code> to disable.
<code>highlight</code>	A character vector of SNPs in your dataset to highlight. These SNPs should all be in your dataset.
<code>logp</code>	If <code>TRUE</code> , the $-\log_{10}$ of the p-value is plotted. It isn't very useful to plot raw p-values, but plotting the raw value could be useful for other genome-wide plots, for example, peak heights, bayes factors, test statistics, other "scores," etc.
<code>annotatePval</code>	If set, SNPs below this p-value will be annotated on the plot.
<code>annotateTop</code>	If <code>TRUE</code> , only annotates the top hit on each chromosome that is below the <code>annotatePval</code> threshold.
<code>...</code>	other possible parameters

Value

A Manhattan plot

col	A character vector indicating which colors to alternate.
chrlabs	A character vector equal to the number of chromosomes specifying the chromosome labels (e.g., <code>c(1:22, "X", "Y", "MT")</code>).
suggestiveline	Where to draw a "suggestive" line. Default $-\log_{10}(1e-5)$. Set to FALSE to disable.
genomewideline	Where to draw a "genome-wide significant" line. Default $-\log_{10}(5e-8)$. Set to FALSE to disable.
highlight	A character vector of SNPs in your dataset to highlight. These SNPs should all be in your dataset.
logp	If TRUE, the $-\log_{10}$ of the p-value is plotted. It isn't very useful to plot raw p-values, but plotting the raw value could be useful for other genome-wide plots, for example, peak heights, bayes factors, test statistics, other "scores," etc.
annotatePval	If set, SNPs below this p-value will be annotated on the plot.
annotateTop	If TRUE, only annotates the top hit on each chromosome that is below the <code>annotatePval</code> threshold.
